

## Bomb Mitigation Container System

### Benefits

- **NEW** upgrade mitigates Package Bombs up to 10 pounds or more
- **NEW** simple and durable upgraded latches and locks
- 2-piece “disintegrating lid” system limits size of explosive and potential shrapnel
- Immediate deterrence of current threats
- Permanent or temporary installation
- Affordable and easily deployable today
- Optional Side Message frames for Public Service or Advertising Messages (generates revenue)

### Product Description

(Design on file with the US Patent Office)

Package Bombs are a significant threat in places where people gather or are in transit. Traditional trash, recycling and other containers continue to be the terrorist-preferred concealment locations for package bombs.

The Bomb Mitigation Container System (BMCS) replaces those traditional containers, deterring or defeating a major threat in public access areas.

#### The “Good Guy” Dilemma

Simply removing all traditional containers is not a viable option. Your personnel would waste valuable time by responding to each large piece of refuse as a potential threat. However, no response invites terrorists to place their weapons at will in areas where package bombs will do great damage, potentially killing and injuring over 100 people in a single attack.

#### The BMCS Solves The Problem

The Bomb Mitigation Container System is affordable enough to deploy on a wide basis in all public access areas.

The BMCS is strong enough to defeat and mitigate package bombs up to and in excess of 10 pounds of TNT or equivalent.

This solution provides in-depth defense. It can outright defeat a package bomb and it can mitigate overcharges. And, its deterrence value is invaluable because terrorists will be discouraged from attempting an attack of this type due to strong, well-placed containers

The BMCS is on duty with the Statue of Liberty, National Airport, FBI Headquarters and other well-known strategic locations.
